

6FT CATERER GAS BARBECUE

- 1) Stand Barbecue upright.
- 2) Connect regulator to propane gas cylinder tightly. Ensure the gas control knobs (one at either end of the barbecue) are turned off and that the dial on the regulator is turned up to 10 for maximum gas feed.
- 3) Underneath the barbecue there are two ignition holes, one either side.
- 4) Turn on the gas at bottle.
- 5) Hold a lighted match under one ignition hole and turn on the appropriate gas control knob.
- 6) This should suck the flame into the ignition hole and ignite the gas hence lighting one half of the barbecue.
- 7) Repeat with the other ignition hole and appropriate gas control knob.
- 8) Heat level can be adjusted with the dial on the regulator (more accurate) or the gas control knob on the barbecue.
- 9) When finished cooking turn off both gas control knobs and turn off gas at bottle.
